

Abstract

An apparatus (10) includes an inflatable vehicle occupant protection device (12) and a vent opening (44) for directing flow of inflation fluid away from the protection device. A vent member (46) is movable between an open condition enabling flow of inflation fluid through the vent opening and a closed condition at least partially blocking flow of inflation fluid through the vent opening. A member (50) is operative to move the vent member (46) from the open condition to the closed condition in response to deployment of the protection device (12). Latching means (48) has a latched condition for maintaining the vent member (46) in the closed condition and an unlatched condition for preventing the vent member from remaining in the closed condition. Control means (102) is operative to actuate the latching means (48) selectively to the latched condition and the unlatched condition based on at least one sensed occupant condition.
